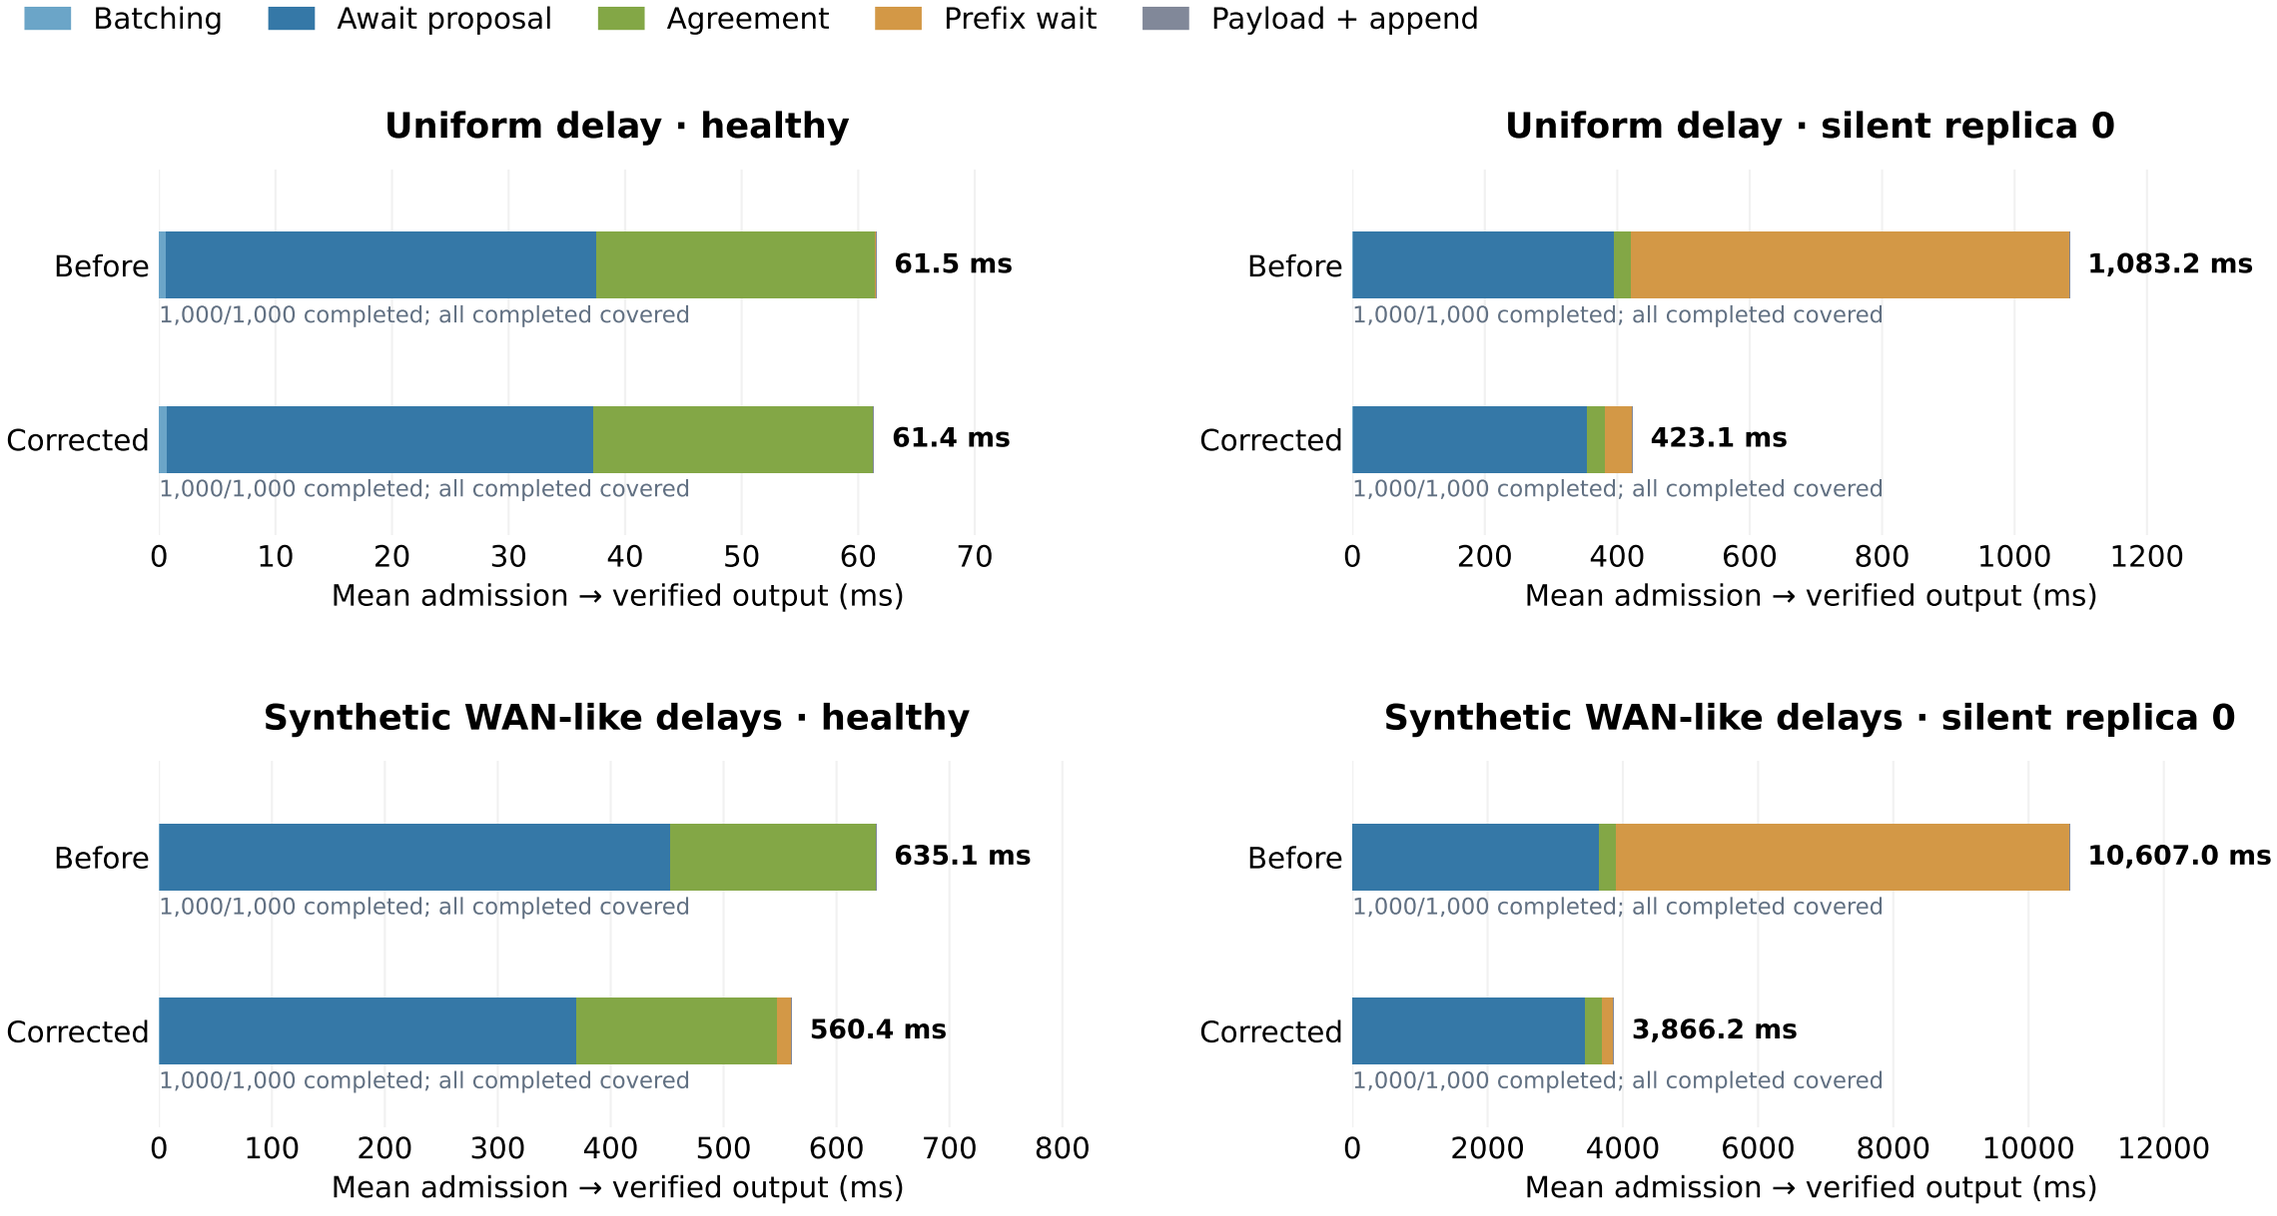
# Delugi freshness correction: matched local processes

4 independent release processes · 100 tx/s · 2 s warmup + 10 s input · 1 useful byte/tx



Uniform: δ = 10 ms, Δ = 100 ms. Synthetic WAN-like matrix: Δ = 1,000 ms; two edges are estimates.

Origin-local proposal acceptance separates await-proposal and agreement. Panel scales differ.

Userspace TCP delay and memory records; no bandwidth cap. These are local diagnostics, not another cloud evaluation.
